

PORTACOOOL®

APEX SERIES

What is Pre-Soak?

Pre-Soak mode is a feature integrated into Portacool's Apex Lineup that streamlines the process of preparing the media before full operation. Its primary function is to ensure that the media is adequately saturated with water, reducing the risk of water blowing off the media and ensuring peak performance from the onset of operation.

How it Works

When you turn on your cooler, Pre-Soak Mode automatically initiates, beginning the process of soaking the media. During this time, the cooler will optimize the pump and fan operation to quickly saturate the media and display time remaining. After the cooler has saturated the media, the cooler will operate according to the selected fan speed and cooling mode.

Skipping Pre-Soak

While Pre-Soak mode automatically activates when you turn on your cooler, you have the option to dismiss it if desired. However, it's important to note that allowing Pre-Soak Mode to complete its cycle ensures the best performance from your cooler.

To skip Pre-Soak, simply attempt to change the fan speed or cooling mode.
